

WHAT IS CLAIMED IS:

1. A tool set for disassembling car audio devices comprising:

two handles capable of being disposed opposite to each other, and each of said two handles having a chamber disposed therein and two
5 sidewalls respectively and oppositely disposed at both sides thereof, each of said two sidewalls having an axle hole disposed thereon and at least one elastic retaining piece disposed thereon, said two axle holes disposed opposite to each other and capable of being passed through by a pivot axle;

10 two tool assemblies capable of being respectively pivoted in said two chambers of said two handles, each of said two tool assemblies composed of a plurality of tool members of different types, wherein one of said plurality of tool members is in a U-shape and provided with a bent part, and the rest of said plurality of tool members each has a pivoting part
15 disposed at one end thereof and provided with a through hole; and,

whereby said tool set is convenient in carrying by having said two pluralities of tool members of different types pivoted and stored together in said two handles and further having said two U-shaped tool members passing through and engaged by said elastic retaining pieces of said two
20 handles so as to make said two handles abutted against each other and joined together; and said tool set is easy in operation only by holding said two handles to employ said tool members to disassemble car audio devices from vehicles quickly.
